

Sweet Pepper: Case Study Plan (Challenge & Pivot)

Target: Canadian Market (Emphasis on Systems, Bilingual Architecture, and Privacy)

1. The Hook (TL;DR & The Output)

Start with the delicious finished product and the business reality.

- **The Problem:** 1 venue, 4 distinct daily identities (breakfast, lunch, bar, club), and a 50/50 food/drink revenue split.
- **The Constraints:** A bilingual audience and complex privacy/data laws requiring custom consent UI.
- **The Output:** A 30-second looping video/GIF of the day-to-night transition, the responsive grid, and the live site.

2. Challenge A: The "No-Clock" Hospitality Rule (UX & Iteration)

Show them you understand users and are willing to kill your darlings.

- **The Concept:** Hospitality dictates guests shouldn't think about time. So, how do you show 4 dayparts without a clock?
- **The Pivot:** Show the 6 AI-generated "Heat = Time" spice sliders. Then, explain how **usability testing killed it**. It was too complex.
- **The Solution:** The resilient 4-tile photo grid. You kept the slider as a delightful "page loader" Easter egg, proving you balance usability with brand joy.

3. Challenge B: The Bilingual Architecture

This is where you win the Canadian hiring manager. Connect RU/EN directly to how you would handle EN/FR.

- **The Rule:** "Register Twins, not translations." Explain how you designed the system to accommodate different language lengths, rhythms, and tones without breaking the UI.
- **The Implementation:** One document, two languages rendered server-side. No lazy auto-translate plugins. Show the UI adapting seamlessly between English and Russian, proving you know how to build UI components that survive bilingual expansion.

4. Challenge C: The Accessibility Audit (AODA/WCAG Readiness)

Canada has strict accessibility laws. Show them you audit your own work.

- **The Problem:** The brand was loud (reds, greens, yellows). Initial checks assumed it was "colour-blind safe."
- **The Audit:** You recomputed the contrast ratios manually and found the claim was false under protanopia.

The Solution: *The new rule: "No color carries meaning alone."** Show how you separated state changes into outlines and fills, rather than just color swaps. This proves deep systems maturity.

5. Challenge D: The Privacy & Consent UX

Turn legal constraints into good design. Show modern AI workflows.

- **The Problem:** Legal requirements (cookie banners, privacy policies) usually ruin the visual experience and frustrate users.
- **The AI Workflow:** Explain how you used an AI agent to rapid-prototype the complex logic of dual-consent (Analytics vs. Maps) to quickly solve the "blank page" problem.
- **The Human Polish:** Show the Figma frames. Explain how you applied Gestalt principles (proximity) and strict brand rules (typography hierarchy, Lime focus states, 6-second success timers) to make the consent dialog feel native and premium.
- **The Result:** A fully compliant, accessible privacy hub that users can actually navigate.

6. Reflection: The Browser as the Drawing Board

Close with how you work.

- Explain your philosophy of moving out of Figma and into the browser for final decisions.
- Highlight the `testing.md` log—show that you record your assumptions, predictions, and failures in daylight.
